

Table 1: Methods and Techniques Categories of Security Skills

ID	Methods/Techniques Category	Marker/Evidence Used for Assignment	Count
MTC-01	LLM-Native Static Reasoning	Instructs the model to inspect code and reason with built-in security patterns or rubrics, without running external tools.	1,477
MTC-02	External Security-Tool Orchestration	Runs named security tools such as Semgrep, CodeQL, Bandit, Trivy, Checkov, Slither, Nuclei, SQLMap, or Nmap and interprets their results.	1,401
MTC-03	Pattern / Regex / AST Grep Scanning	Scans code using grep, ripgrep, ast-grep, or custom regex/pattern rules as the primary mechanism.	435
MTC-04	Manifest & Advisory-Database Lookup	Reads manifests or lockfiles and checks dependencies against advisory sources such as NVD, GHSA, OSV, npm audit, or pip-audit.	295
MTC-05	Dynamic Probing & Active Exploitation	Interacts with a live target using requests, payloads, exploits, browsers, or proxies to trigger and observe security-relevant behavior.	1,510
MTC-06	Fuzzing & Property-Based Testing	Generates mutated or randomized inputs to trigger faults using fuzzers or property/invariant testing.	88
MTC-07	Binary Instrumentation & Reverse Engineering	Uses disassemblers, debuggers, instrumentation, or sanitizers, such as Ghidra, radare2, GDB, or Frida, for analysis.	232
MTC-08	Configuration & Policy Compliance Evaluation	Parses configuration, IaC, or cloud-state artifacts and checks them against security rules, policies, or benchmarks.	181
MTC-09	Checklist / Framework-Driven Review	Reviews a target systematically using a structured standard, framework, or control checklist such as OWASP ASVS, CIS, NIST, or SOC 2.	397
MTC-10	Threat Modelling & Architectural Analysis	Analyzes data flows, trust boundaries, and attack paths to derive threats from system architecture rather than artifact scanning.	126
MTC-11	Multi-Agent / Pipeline Orchestration	Uses multiple sub-agents or specialized analysis phases as the defining workflow.	228
MTC-12	Bundled Custom Analyzer Scripts	Ships and runs its own analyzer scripts, such as Python or shell scripts, that perform the core analysis.	491
MTC-13	Log, Telemetry & Detection-Rule Analysis	Analyzes logs, events, or telemetry, or creates detection content such as YARA, Sigma, or SIEM rules.	290
MTC-14	Reference / Advisory Knowledge Delivery	Provides curated security knowledge, patterns, or remediation guidance without performing target-specific analysis.	104
MTC-15	API / Platform Data Integration	Uses vendor or platform APIs, such as Snyk, GitHub Security, Dependabot, or cloud-security services, as the primary analysis mechanism.	212
